

PROJECT MANAGEMENT

Waste management from A to Z

Waste is a moving issue – across borders and different industries. For many companies, however, it is the end of the process chain, where it frequently turns into a problem. How can large volumes of waste be disposed of properly and correctly? What should be done with contamination? We, ZECH UMWELT GmbH, have the right answers to these questions – not only from the environmental, but also from the economic perspective. Whatever the material – plastics and metals, mineral or other industrial waste materials – we get to the root of the matter. With innovative, eco-friendly processes we clean, treat and dispose of waste and contamination from industry and commerce. In doing so, we operate at all times in compliance with current laws and environmental protection directives. Because one thing we do know: improper disposal of waste can be a costly matter.

One offer – many services

Let your waste problem be ours. We would like you to be able to concentrate completely on your day-to-day business – and feel good about it. That's why we offer a complete range of services covering all aspects of waste management and disposal: our engineers and environment experts survey the situation on site, offer consultancy services, take responsibility for implementing remediation measures and coordinate the smooth transportation of waste – including process monitoring and obtaining all the licenses and permits required. All these services are driven by a professional approach and specialist expertise: our company is part of the international ZECH GROUP – a strong group of companies in the building industry.

Remediation – soil good, everything good: You want to restore a contaminated site and return it to the economic chain? We will gladly take charge of the matter for you: Zech Umwelt GmbH is specialised in the remediation of useful land. With many years of experience and enormous commitment to sustainability, we survey the site, develop a remediation plan with cost-optimised disposal concepts, ensure implementation and involve local government and authorities to make it a success. Did we forget something? Then get in touch with us!

Transboundary shipments of waste – Europe is all one: Our work does not stop at remediation. We go a step further – across borders, too. With state-of-the-art plant facilities and processing methods for recycling and eliminating waste, our company plays a pioneering role in Europe and is opening up new options worldwide for transboundary shipments of waste. One thing of special importance to us is to be a reliable and dependable partner for our customers. For this reason, we are always in compliance with the most recent legislation and notification procedures, and have in-depth expertise regarding the various options for waste transportation logistics by road, rail and sea.

Recycling industrial waste – we process building waste and soil: Our company has cutting-edge plant technology at its disposal which enables us to provide eco-friendly processing of a wide range of wastes, for example from oil refineries, agriculture and forestry. We clean wastewater sludge, railtrack ballast and waste from grit chambers, and recycle building and demolition waste, street sweepings and biologically degradable waste. One example of our capacities: in our stationary and mobile soil cleaning plants, we process more than two million metric tons of mineral waste a year.

Disposal services – signed and sealed: If we are unable to treat a particular waste stream in our own facilities, we have competent partners at our side. For many years already, we have been working in a well-established and proven network with a number of specialised recycling companies whose capacities we are able to utilise. We are licensed under the Closed Substance Cycle and Waste Management Act (KrWAbfG) to provide these waste disposal services and are therefore certified under the Specialist.
